Divide the base of one loop of the curve into $(n + 1)$ equal parts, so that the angle equivalent to the linear distance between any two points of division will be. The ordinate at the (x) -th point of $n + 1$ division will then be. $180. 180 e. = a. s \ln (-a, \sin h k 180, k 180 + /, \cos f-0, \cos 3---h. 1 n + 1 3 J - + 1$ If similar equations are formed for the ordinates at each point of division, there result n equations of the first degree, by means of which the constants, $av av-,6v by-,$ to n terms can be determined. The general solution for any pair of coefficients, such as am and bm , takes the form $2 r. / 180. / 180 (l) + eTM(kmr) +-+ -\sin (ww+i)$ The significance of these equations from the graphical standpoint can be seen by referring to Fig. 2, which represents in polar coordinates the curve of Fig. I. Here the original $(n + i)$ equal linear divisions are replaced by the $(- 4-i)...$
